

Kaira Loro Architecture Competition

Primary School

1. DESIGN

Education fosters social cohesion and stability within communities. By providing a common educational experience, primary schools create opportunities for children from diverse backgrounds to interact, learn together, and develop mutual understanding, tolerance, and respect. This can contribute to peaceful coexistence and social harmony. Primary school with its modest yet welcoming design creating a communal understanding starting from primary education system. Dividing the spaces into three by pulling back from the road, but creating on an axis by not interrupting the transition between spaces, will strengthen the relations that are desired to be preserved in the education system. While the walls protect the children, but not by limiting them, also characterize the common playground at the end of the horizontal axis. This dynamic relation between creates both a space for encounter and retreat. Letting children deciding where they are going to exist. Starting from management to end with common playground creating a safe zone for children that they can feel at ease in the class by letting hem know through spaces that they are key for the society. Playground exists a common grandstand to keeping the social interaction to be able to stop for a minute and sharing with each other. While the form of the roof provides the air flow in the space, the dynamic roof structure makes itself visible in the spaces, making the building a part of the experience.

2. USING OF MATERIALS

Using materials where children can focus but yet to urge to discover are principles for the primary school. Rammed earth walls is used as a main structural walls. The texture and the colour creates a seamless connection through out the building. Rosewood used in the openings as a framework to complement the earth walls. Using the same material at the roof structure to creating a holistic approach on building vertically and horizontally rosewood beams were chosen. To alleviate the roof corrugated metal is used at the covering of roof.

3. CONSTRUCTION PROCESS

The structure sits on compacted soil with its load bearing elements which is rammed earth. Rammed earth is a way to build a structure with communal relationships. Rammed earth is build with step by step starting from first layer an then compacting the soil. This process can be a point that community can build together. Openings are secured by concrete lintel and again concrete used in bond beam at the top of the earth wall. The structure of the roof is by cross wooden connections. These wooden connections are placed inside the compressed earth wall and together with the wall, they form the load-bearing structure of the building. Then corrugated metal sheet can be put on top of the structure. While these two main structure is can be build by local community members wooden roof structure can be easily learned by its simple and repetitive design.

4. ESTIMATE OF MATERIAL COSTS

Material	Quantity	Total Costs
Rosewood Plank (Panels+ Sitting area)	119 pcs +825 pcs	1.362+9.446
Rosewood Beam (Roof Structure)	920pcs	7.822
Red Clay (Walls)	142,75 ton	12.133
Sheet Metal Corrugated (Roof Covering)	470 pcs	2.256
Cement (Concrete)	5,3 ton	636
River Sand (Concrete)	10 m ³	23
Laterite Stone (Concrete)	21,4 ton	1.098
TOTAL		34.776
